Report 1
Group 6

Is internet use linked to self-reported loneliness?

Findings

Placeholder: people who spend more time online than average report no more loneliness than those above the mean are compared with. Placeholder: this holds for regular users only.

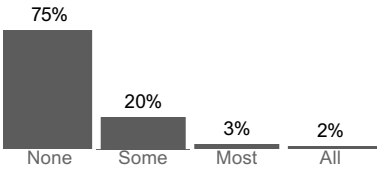

European Social Survey Round 11
Switzerland, 2023
N 1,384 respondents

1 Variables

Dependent
fltlnl

Placeholder: why `fltlnl` was chosen over the other candidate items. Placeholder: why it captures the feeling of loneliness. Placeholder: what Figure 1 shows and what that means for the analysis. Placeholder: at least one limitation of this measure.

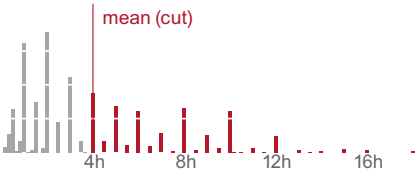

Figure 1 Self-reported loneliness, past week

Independent
netustm

Placeholder: why `netustm` was chosen. Placeholder: what Figure 2 shows about the distribution. Placeholder: who was not asked the question and how those 172 respondents are handled. Placeholder: at least one limitation of this measure.

Figure 2 Self-reported minutes online per day

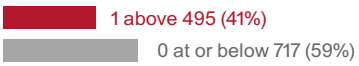

2 Grouping

net_group

Placeholder: the split at 235.6 minutes, with 1 for above the mean and 0 for at or below. Placeholder: how a value exactly on the mean is handled. Placeholder: why the groups are unequal.

Figure 3 Groups, N 1,212, mode 0

3 Descriptives

Placeholder: the recoding performed. Placeholder: what the descriptives of loneliness show. Placeholder: what the descriptives of internet time show. Placeholder: anything notable, such as heaping, outliers or missingness.

Table 1	fltlnl	netustm
Valid N	1,382	1,212
Mean	1.31	235.6
Median	1	180
Mode	1	120
Variance	0.38	39,098
SD	0.61	197.7
Range	1–4	4–1,080
IQR	0	270

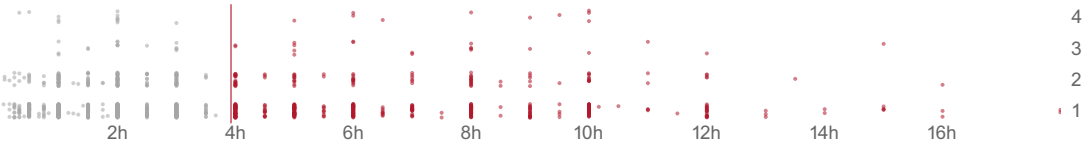

4 Test

Placeholder: the test chosen and why it fits two independent groups of unequal size and spread. Placeholder: the hypothesis being tested.

Group	N	SD
0 at or below	715	0.59
1 above	495	0.65

Figure 5

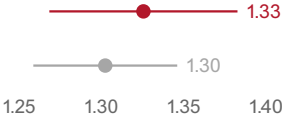

Every respondent, self-reported loneliness (1–4, jittered) by self-reported minutes online, red above the mean

5 Interpretation

Placeholder: the two groups compared and what Figure 4 shows about their means. Placeholder: the direction and size of the difference and what the p-value says. Placeholder: what this means for the research question in plain language. Placeholder: the limitation of the cut point, read from Figure 5, and what Report 2 will do instead.

Figure 4 Mean self-reported loneliness, 95% CI
Welch 1 − 0: +0.02 (−0.05 to 0.09)
t 0.63, df 1004, p 0.53
